                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       W18842-70 are peptide fragments of the 65 kD human glutamic acid decarboxylase (GAD). The fragments are autoreactive substances used for diagnosis of insulin-dependent diabetes mellitus (IDDM). The diagnosis is determined by using a claimed method for diagnosis of cell-mediated diseases or a predisposition to cell-mediated diseases, which is effected by administering an autoreactive substance intradermally and establishing the diagnosis on the basis of the occurrence or lack of a positive reaction at the site of administration. The method is used for diagnosis of autoimmune and tumour diseases, preferably T-cell-mediated diseases such as rheumatoid arthritis, multiple sclerosis and especially IDDM.

                                                                                                                                                    decarboxylase (GDD). The fragments are autoreactive substances used for diagnosis of insulin-dependent diabetes mellitus (IDDM). The diagnosis is determined by using a claimed method for diagnosis of cell-mediated diseases or a predisposition to cell-mediated diseases, which is effected by administering an autoreactive substance intradermally and establishing the diagnosis on the basis of the occurrence or lack of a positive reaction at the site of administration. The method is used for diagnosis of autoimmune and tumour diseases, preferably T-cell-mediated diseases such as rheumatoid arthritis, multiple sclerosis and especially IDDM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Apolipoprotein A-I; agonist; dyslipidemic disorder; dyslipidemia; human: lecithin:roblesterol acyltransferase; LGAT; hypercholesterolaemia; cardiovascular disease; atheroseclerosis; restenosis; HDL; apoA-I; high density lipoprotein; hypertriglyceridemia; metabolic syndrome;

dyslipidemia, specifically hypercholesterolaemia, cardiovascular disease, atherosclerosis, restenosis, HDL (high density lipoprotein) or apoA-I deficiency; hypertriglyceridemia and metabolic syndrome, also for treating septic shock. When labeled, (A) can also be used diagnostically to measure serum levels of HDL, in particular the HDL subpopulation that is involved in retrograde cholesterol transport, also to image HDL at e.g. atherosclerotic streaks, and to raise antibodies. Y18934 to Y19187 represent lecithin:cholesterol acyltransferase (LCAT) activity exhibiting core peptides, which are apoA-I agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Apolipoprotein A-I; agonist; dyslipidemic disorder; dyslipidemia; human; lecithin:roblesterol acyltransferase; LGAT; hypercholesterolaemia; cardiovascular disease; atheroseclerosis; restenosis; HDL; apoA-I; high density lipoprotein; hypertriglyceridemia; metabolic syndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes an agonist (A) of apolipoprotein A-I dapoally which is a 14-22 residue peptide, or analog, that forms an amphipathic alpha-helix in presence of lipids. (A) and their lipid complexes, are used to treat or prevent diseases associated with disklipidemia, specifically hypercholesterolaemia, cardiovascular disease, atherosclerosis, restenosis, libit (Algh density lipoprotein) or apoA-I deficiency; hypertriglyceridemia and metabolic syndrome, also for treating septic shock. When labeled, (A) can also be used disponsitically to measure serum levels of HDL, in particular the HDL subpopulation that is involved in retrograde cholesterol transport, also to image HDL at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Lecithin: cholesterol acyltransferase activation exhibiting peptide #129.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a nucleic acid (A) encoding an apolipoprotein A-I (apoA-I) agonist (B) that is a peptide, or analog, which forms an amphipathic alpha-helix in presence of lipids. (A), optionally as a complex with lipids, and host cells that contain (A), are useful for gene therapy, or prevention, of diseases associated with a tensor of special properties. (A) are useful for gene therapy, or prevention, of diseases associated with a tensor of special properties. (B) the density lipoprotein and apoA-I deficiency, hypertriglyceridemia and metabolic syndrome, also to treat endotoxemia (spetic shock). Host cells containing (A) can also be used to study the role of apoA-I in lipid metabolism. (B) can be used diagnostically, e.g. to measure serum HDL (particularly its subpopulation involved in retrograde cholesterol transport) and for imaging the circulatory system or HDL accumulations at fatty streaks. The present sequence represents a peptide from the present invention.
                                                                                                                                            ô
                                                                                                                                                                                                                                                                                                                                                                            Lecithin: cholesterol acyltransferase activation exhibiting peptide #129.

The present invention describes an agonist (A) of apolipoprotein A-I (apoA-I) which is a 15-29 residue peptide, or analog, that forms an amphipathic alpha-helix in presence of liphds. (A), and their lipid complexes, are used to treat or prevent diseases associated with dyslipidemia, specifically hypercholesterolaemia, cardiovascular disease, atheroscierosis, restenosis, HDL (high density lipoprotein) or apoA-I deficiency; hypertriglyceridemia and metabolic syndrome, also for treating septic shock. When labeled, (A) can also be used diagnostically to measure serum levels of HDL, in particular the HDL subpopulation that is involved in retrograde cholesterol transport, also to inage HDL at subrosclerotic streaks, and to raise antibodies. Y19188 to X19441 represent lecithin:cholesterol acyltransferase (LCAT) activity exhibiting core peptides, which are apoA-I agonists.
                                                                                                                                 Apolipoprotein A-I; agonist; dyslipidemic disorder; dyslipidemia; human; lecithin:roblesterol acyltransferase; LGMT; hypercholesterolaemia; cardiovascular disease; atheroseclerosis; restenosis; HDL; apoA-I; high density lipoprotein; hypertriglyceridemia; metabolic syndrome;
                                                                                                    Lecithin: cholesterol acyltransferase activation exhibiting peptide #129.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ΰ

The products of the invention and their encoding nucleic acids may be useful for treating diseases and conditions related to aging, cellular differentiation, physical insult (e.g. physical trauma, anoxia, hyperthermia, hypothermia, chemically induced damage, and trauma to the brain, spinal cord, kidney, heart, lungs, liver, skin and any other organ), viral disorders (e.g. hepatitis, retroviral infections, viral encephalitis, and AIDS/HIV), neurodegenerative disorders (e.g. Parkinson's disease, Alzheimer's disease, Huntington's disease, eerebellar degenerations, and familial amyotrophic lateral sclerosis (FALS)), cardiovascular disease (e.g. atherosclerosis, myocardial infarction, heart failure, cardiomyopathy, myocardial reperfusion injury, and hypertensive heart disease), immune disease (e.g. rheumatoid

The present invention describes an agonist (A) of apolipoprotein A-I (apoA-I) which is a 15-29 residue peptide, or analog, that forms an amphipathic alpha-helix in presence of lipids. (A), and their lipid complexes, are used to treat or prevent diseases associated with dyslipidemia, specifically hypercholesterolaemia, cardiovascular disease, atteroscierosis, restenosis, HDL (high density lipoprotein) or apoA-I deficiency; hypertriglyceridemia and metabolic syndrome, also for treating septic shock. When labeled, (A) can also be used diagnostically to measure serum levels of HDL, in particular the HDL subpopulation that is involved in retrograde cholesterol transport, also to image HDL at e.g. atherosclerotic streak, and to raise antibodies. Y18934 to Y19187 represent lecithin:cholesterol acyltransferase (LCAT) activity
                                                                                                                                                                                                                                                                                                                                                                                                          exhibiting core peptides, which are apoA-I agonists.

Peptide agonists of apolipoprotein A-I

Example; Page 111; 152pp; English.

The present invention describes an agonist (A) of apolipoprotein A-I applay. In which is a 14-22 residue peptide, or analog, that forms an amphipathic alpha-helix in presence of lipids. (A), and their lipid complexes, are used to treat or prevent diseases associated with dyslipidemia, specifically hypercholesterolaemia, cardiovascular disease.

The pulmonary surfactant protein is generated by cleavage of a larger precursor protein synthesised by pulmonary type II epithelial cells and affects the surfactant like activity of phospholipids. The peptide shown is the creatment of pulmonary surfactant deficient diseases, including hyaline membrane disease, and/or abnormal states, including acute respiratory distress syndrome and can also be used for drug delivery systems.
                                                                                                                                                                                                                                                                                                               SP-B; surfactant; phospholipids; pulmonary type II epithelial cells; hyaline membrane disease; acute respiratory distress syndrome; pulmonary drug delivery.

(A), and their lipid complexes, are used to treat or prevent diseases associated with dyslipidemia, specifically hypercholesterolaemia, cardiovascular disease, atheroscierosis, restenosis, HDL (high density lipoprotein) or apoa-I deficiency; hypertriglyceridemia and metabolic syndrome, also for treating septic shock. When labeled, (A) can also be used diagnostically to measure serum levels of HDL, in particular the HDL subpopulation that is involved in retrograde cholesterol transport, also to image HDL at e.g. atherosclerotic streaks, and to raise antibodies. Yi9188 to Y19441 represent lecithin:cholesterol acyltransferase (LCAT) activity exhibiting core peptides, which are apoA-I agonists.
                                                                                                                                                                                                                                                                                                                                                                        Apolipoprotein A-I; agonist; dyslipidemic disorder; dyslipidemia; human; lecithin:roblesterol acyltransferase; LGNT; hypercholesterolaemia; cardiovascular disease; atheroseclerosis; restenosis; HDL; apoA-I; high density lipoprotein; hypertriglyceridemia; metabolic syndrome;
                                                                                                                                                                                                                                                                                                                                             Lecithin:cholesterol acyltransferase activation exhibiting peptide #130
subpopulation involved in retrograde cholesterol transport) and for imaging the circulatory system or HDL accumulations at fatty streaks. The present sequence represents a peptide from the present invention.

                                                                                                                                                                                       The pulmonary surfactant protein is generated by cleavage of a larger precursor protein synthesised by pulmonary type II epithelial cells and affects the surfactant like activity of phospholipids. The peptide shown is a cleam in tragment (residues 58-78) which can be used for the treatment of pulmonary surfactant deficient diseases, including hyaline membrane disease, and/or abnormal states, including acute respiratory distress syndrome and can also be used for drug delivery systems.
                                                                                          Compsn. having surfactant activity when admixed with phospholipid - comprising pulmonary surfactant protein fragments, used in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SP-B; surfactant; phospholipids; pulmonary type II epithelial cells; hyaline membrane disease; acute respiratory distress syndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The monoclonal antibody is useful in the purification and isolation of human erythropoletin from plasma by affinity chromatography. It as also useful in immunosasays on human body fluids for erythropoletin determination, e.g. in the diagnosis of hypoxia etc. involving low or defective red blood cell prodn.
                                                                           Sequence from erythropoietin used to produce monoclonal antibodies from cell line ATCC HB 8209.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

dyslipidemia, specifically hypercholesterolaemia, cardiovascular disease, atherosclerosis, restenosis, HDL (high density lipoprotein) or apoA-I deficiency; hypertriglyceridemia and metabolic syndrome, also for treating septic shock. When labeled, (A) can also be used diagnostically to measure serum levels of HDL, in particular the HDL subpopulation that is involved in retrograde cholesterol transport, also to image HDL at e.g. atherosclerotic streaks, and to raise antibodies. Y18680 to Y18933 represent lecithin:cholesterol acyltransferase (LCAT) activity exhibiting core peptides, which are apoA-I agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 apolipoprotein A.I. (apoA-1) agonist (B) that is a peptide, or analog, which forms an amphipathic alpha-helix in presence of lipids. (A), or or prevalent is a period of the contain (A), are useful for gene therapy, or prevention, of diseases associated with dyslipidemia, specifically hypercholesterolaemia, cardiovascular disease, atheroscierosis, restenosis, HDL (high density lipoprotein) and apoA-I deficiency, hypertriglyceridemia and metabolic syndrome, also to treat endotoxemia (septic shock). Host cells containing (A) can also be used to study the role of apoA-I in lipid metabolism. (B) can be used

                                           (apoA-1) Which is a 15-29 residue peptide, or analog, that forms an amphipathic alpha-helix in presence of lipids. (A), and their lipid complexes, are used to treat or prevent diseases associated with dyslipidemia, specifically hypercholesterolaemia, cardiovascular disease, atheroscierosis, restenosis, HDL (high density lipoprotein) or apoA-1 treating septic shock. When labeled (A) can also be used diagnostically to measure serum levels of HDL, in particular the HDL subpopulation that is involved in retrograde cholesterol transport, also to image HDL at egges atherosclerotic streaks, and to raise antibodies. Y18934 to Y19187 represent lecithin:cholesterol acyltransferase (LCAT) activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Apolipoprotein A-I; agonist; dyslipidemic disorder; dyslipidemia; human: lectithin:rohlesterol acyltransferase; LGAT; hypercholesterolaemia; cardicovascular disease; atheroseclerosis; restenosis; HDL; apoA-I; high, density lipoprotein; hypertriglyceridemia; metabolic syndrome;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (apoA-1) which is a 15-29 residue peptide, or analog, that forms an amphipathic alpha-helix in presence of lipids. (A), and their lipid complexes, are used to treat or prevent diseases associated with dyslipidemia, specifically hypercholesterolaemia, cardiovascular disease, atherosclerosis, restenosis, HDL (high density lipoprotein) or apoA-1 deficiency; hypertrigity residemia and metabolic syndrome, also for treating septic shock. When labeled, (A) can also be used diagnostically to measure serum levels of HDL, in particular the HDL subpopulation that is involved in retrograde cholesterol transport, also to image HDL at e.g. atherosclerotic streaks, and to raise antibodies. 19188 to 19181 represent lecithin:cholesterol acyltransferase (LCAT) activity exhibiting core peptides, which are apoA-1 agonists.
                                                                                                                                                                                                                                                                                                      Apolipoprotein A-I; agonist; dyslipidemic disorder; dyslipidemia; human: lecithin:roblesterol acyltransferase; LGAT; hypercholesterolaemia; cardiovascular disease; atherosclerosis; restenosis; HDL; apoA-I; high density lipoprotein; hypertriglyceridemia; metabolic syndrome;
                                                                                                                                                                                                                                                                                Lecithin:cholesterol acyltransferase activation exhibiting peptide #40
diagnostically, e.g. to measure serum HDL (particularly its subpopulation involved in retrograde cholescerol transport) and for imaging the circulatory system or HDL accumulations at fatty streaks. The present sequence represents a peptide from the present invention.
                                                                                                              Gaps

Apolipoprotein A-I; agonist; dyslipidemic disorder; dyslipidemia; human; lectithin:rohlesterol acyltransferase; LGAT; hypercholesterolaemia; cardicovascular disease; atherosclerosis; restenosis; HDL; apoA-I; high density lipoprotein; hypertriglyceridemia; metabolic syndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes an agonist (A) of apolipoprotein A-I (apoA-I) which is a 15-29 residue peptide, or analog, that forms an amphipathic alpha-helix in presence of lipids. (A), and their lipid complexes, are used to treat or prevent diseases associated with dyslipidemia, specifically hypercholesterolaemia, cardiovascular disease, atherosclerosis, restenosis, HDL (high density lipoprotein) or apoA-I deficiency; hypertriglyceridemia and metabolic syndrome, also for treating septic shock. When labeled, (A) can also be used diagnostically to measure serum levels of HDL, in particular the HDL subpopulation that is involved in retrograde cholesterol transport, also to image HDL at e.g. atherosclerotic streaks, and to raise antibodies. Y18934 to Y19187 represent lecithin:cholesterol acyltransferase (LCAI) activity exhibiting core peptides, which are apoA-I agonists.
Lecithin:cholesterol acyltransferase activation exhibiting peptide #256.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score 31.5; DB 20; Length 16; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes an agonist (A) of apolipoprotein A-I (apoA-I) which is a 14-22 residue peptide, or analog, that forms an amphipathic alpha-helix in presence of lipids. (A), and their lipid complexes, are used to treat or prevent diseases associated with dyslipidemia, specifically hypercholesterolaemia, cardiovascular disease, atherosclerosis, restenosis, HDL (high density lipoprotein) or apoA-I deficiency; hypertriglyceridemia and metabolic syndrome, also for treating septic shock. When labeled, (A) can also be used diagnostically to measure serum levels of HDL, in particular the HDL subpopulation that is involved in retrograde cholesterol transport, also to image HDL at e.g. atherosclerotic streaks, and to raise antibodies. Y18680 to Y18933 represent lecithin:cholesterol acyltransferase (LCAT) activity exhibiting core peptides, which are apoA-I agonists.
                                                                                                                                                                                                                                                                                                                              Apolipoprotein A-I; agonist; dyslipidemic disorder; dyslipidemia; human: lectithin:cholesterol acyltransferase; LCAF; hypercholesterolaemia; cardicovascular disease; atherosclerosis; restenosis; NDL; ADDA-I; high density lipoprotein; hypertriglyceridemia; metabolic syndrome;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a nucleic acid (A) encoding an apolipoprotein A-1 (apoA-1) agonist (B) that is a peptide, or analog, which forms an amphipathic alpha-helix in presence of lipids. (A), optionally as a complex with lipids, and host cells that contain (A), are useful for gene therapy, or prevention, of diseases associated with dyslipidemia, specifically hypercholesteroleemia, cardiovascular disease, atherosclerosis, restenosis, HDL (high density lipoprotein) and apoA-1 deficiency, hypertriglyceridemia and metabolic syndrome, also to treat endotoxemia (septic shock). Host cells containing (A) can also be used to study the role of apoA-1 in lipid metabolism. (B) can be used diagnostically, e.g. to measure serum HDL (particularly its subpopulation involved in retrograde cholesterol transport) and for imaging the circulatory system or HDL accumulations at fatty streaks. The present sequence represents a peptide from the present invention.
                                                                       Lecithin:cholesterol acyltransferase activation exhibiting peptide #256.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                     Carroll P.A., Zhao G., Boyko S.A., Winkler M.E., Calderwood S.I "Identification, sequencing, and enzymatic activity of the "rythrose-4-phosphate dehydrogenase gene of Vibrio cholerae."; J. Bacteriol. 179-293-296(1997).

-I- CATALYTIC ACTIVITY: ATP + 3-PHOSPHO-D-GLYCERATE = ADP + 3-PHOSPHO-D-GLYCEROYL PHOSPHOTE.
-I- PATHWAY: SECOND STEP IN THE SECOND PHASE OF GLYCOLYSIS.
-I- SUBUNIT: MONOMER (BY SIMILARITY).
-I- SUBCELLULAR LOCATION: CYTOPLASMIC.
-I- SIMILARITY: BELONGS TO THE PHOSPHOGLYCERATE KINASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   UNSURE

beta tubulin b-beta-2 - mouse
C; Species: Mus musculus (house mouse)
C; Apecies: Mus musculus (house mouse)
C; Acte: 07-May-1995 #sequence_revision 21-Jul-1995 #text_change 17-Mar-1999
C; Accession: S48746
R; Mary, J.; Redeker, V.; le Caer, J.P.; Prome, J.C.; Rossier, J.
FEBS Lett. 353, 89-94, 1994
A; Title: Class I and IVa beta-tubulin isotypes expressed in adult mouse brain are
A; Reference number: S48741; MUID:95010772
A; Accession: S48746
A; Status: preliminary
A; Molecule type: protein
A; Residues: 1-20 <MAR>
